The Urban Penalty: Education

Poor rural families migrate to cities seeking greater opportunity. However, the urban advantage of better access to education remains a myth for the majority of slum dwellers. Even if schooling is available, slum families sacrifice the education of their children, particularly girls, so that they can meet the costs of food, rent and transport. Often, there simply are not enough schools within easy reach of slum settlements.

- A 2003 study conducted in the Nairobi slum of Kibera showed that while there were 14 primary schools within walking distance, they could only accommodate 20,000 of the 100,000 primary-age youngsters living in the area. UN-HABITAT’s urban survey data confirms that similar situations exist in other African and Latin American countries. Around the world, 113 million children are not enrolled in school while 130 million young people have grown up illiterate.

The Urban Penalty: HIV/AIDS

An analysis of the spread of HIV/AIDS shows that the disease manifests itself in cities then moves into the countryside along trucking routes, spread by the risky sexual behaviour of truckers and commercial sex workers. In Southern Africa, the disease travelled south along highways from Zambia to South Africa via Zimbabwe, Malawi and Mozambique. It has been carried from the Kenyan port of Mombasa to landlocked Uganda and Rwanda. As long ago as 1994, a study revealed that 50% of truck drivers who plied this route were HIV positive.

Cities and their poor are disproportionately affected by the HIV/AIDS pandemic in both the developed and developing regions of the world. In Burundi, the least urbanised country in Eastern Africa, infections are four times higher in urban areas than in the countryside. In the United States and Canada HIV prevalence is closely linked to urban poverty.

Unlike the early days of the pandemic, women have emerged as being particularly vulnerable for a variety of reasons. These include the risky sexual behaviour of their regular heterosexual partners. In poor urban communities worldwide, women’s sexual rights are often disregarded within the context of non-consensual and unprotected sex.

- Recent research in a low-income section of New York City revealed that women are twice as likely to be infected by their husband or steady partner than by casual sex.
- Similarly, in the Chinese city of Guangzhou more than 70% of women with sexually transmitted diseases said that they had confined sex to their husband or regular partner.
- Women now account for more than one quarter of the new HIV infections in India. Most of those tested said they were in long-term relationships.

The liberalisation of economies in Eastern Europe and Central Asia has engendered stark income inequalities that have unleashed a rapid growth in the HIV infection rate. Intravenous drug use is more to blame than commercial sex. The Russian Federation accounts for more than 70% of all HIV diagnoses in the region.

The HIV/AIDS pandemic’s demographic impact on Africa is profound.

- By 2010, more than 18 million African children will have been orphaned by AIDS.
- Given the current prevalence of HIV, 60% of African 15-year-olds may die before 60.
- The labour force in 34 African countries will shrink by between 5% and 35% by 2020.
